A coolant flush is another name for radiator flush, a procedure to clean your vehicle's cooling system of sediment and rust. The coolant keeps your engine from overheating while running, and from freezing in cold weather when it's not running. The purpose of a radiator flush is to ensure that your coolant system protects your engine as efficiently as possible -- and to prevent corrosion in metal engine parts from rust and other contaminants.

Protect your engine from the elements with a radiator flush. If you're driving a vehicle with an internal combustion engine, then periodically you'll need to flush the radiator and replace the coolant, which is also called antifreeze. Adding fresh radiator coolant with the proper 50/50 mix of coolant and distilled water protects your radiator from overheating in summer and freezing in winter.

How to Flush a Radiator and Change the Coolant

You don't want to discover the significance of antifreeze by being forced to pull over, due to an overheated engine. Antifreeze contains lubricants and anti-corrosion agents to keep components like your radiator properly lubricated and free from corrosion. Not applying the right amount of antifreeze to your radiator can cause your engine to overheat - leaving you with an undriveable vehicle and an expensive repair.
