Description : Thermal Analysis techniques are used in a wide range of disciplines, from pharmacy and foods to polymer science, materials and glasses; in fact any field where changes in sample behaviour are observed under controlled heating or controlled cooling conditions. The wide range of measurements possible provide fundamental information on the material properties of the system under test, so thermal analysis has found increasing use both in basic characterisation of materials and in a ...

Thermometry is by far the oldest and simplest thermal analysis technique. It always involves the measurement of temperature and usually the measurement of time. Heating and cooling curves have been used for many years to establish phase diagrams (Fig. 1). Any type of thermometer can be used for measurement.
