Ladder Logic (LAD) for S7-300 and S7-400 Programming - Siemens

Ladder logic is a visual programming language used to program PLC's (Programmable Logic Controllers). Ladder logic consists of horizontal Rungs and Instructions embedded between vertical Rails on either side. Rungs house instructions which are referenced by tags or variables.

When the contact is closed, ladder rail power flows across the contact and the result of logic operation (RLO) = "1". Otherwise, if the signal state at the specified <address> is "0", the contact is open. When the contact is open, power does not flow across the contact and the result of logic operation (RLO) = "0".

Ladder Logic (LAD) for S7-300 and S7-400 Programming - Siemens

LAD corresponds to the "Ladder Logic" language defined in the International Electrotechnical Commission's standard IEC 1131-3, although there are substantial differences with regard to the operations. For further details, refer to the table of standards in the STEP 7 file NORM_TBL.RTF.

Ladder logic (LAD) is one programming language used with PLCs. Ladder logic incorporates programming functions that are graphically displayed to resemble the symbols used in hard-wired control diagrams. Fig. 3 Example of logical schema in LAD Statement List (STL)- list of instructions.

The first type of timer in ladder logic is the on delay timer. Its name comes from the fact, that the on delay timer delays its output from the on signal. As soon as the on delay timer gets a signal at the input, the timer starts to count down. When the preset time is up, the output of the on delay timer will turn on.

Ladder Logic Examples and PLC Programming Examples

Ladder Logic Program Runs Output Image (PLC Memory) State of Actual Output Device As the ladder logic program is scanned, it reads the input data table then writes to a portion of PLC memory - the output data, table as it executes The output data table is copied to the actual output devices after the ladder logic has been scanned.

The ladder logic programming of all the PLCs is exactly the same, only the addresses can be changed, and the names of the inputs and outputs, while the logic remains the same. If you start with the FATEK PLC it really doesn't mean that in the future you won't be able to write programs for the Siemens, Omron, and Keyence PLC.
