Parallel programming model - Wikipedia

Parallel programming models exist as an abstraction above hardware and memory architectures. Although it might not seem apparent, these models are NOT specific to a particular type of machine or memory architecture. In fact, any of these models can (theoretically) be implemented on any underlying hardware.

Introduction to Parallel Computing

Concurrent programming languages, libraries, APIs, and parallel programming models (such as algorithmic skeletons) have been created for programming parallel computers. These can generally be divided into classes based on the assumptions they make about the underlying memory architecture—shared memory, distributed memory, or shared distributed memory.

Parallel computing - Wikipedia

Parallel computing is a type of computing architecture in which several processors execute or process an application or computation simultaneously. Parallel computing helps in performing large computations by dividing the workload between more than one processor, all of which work through the computation at the same time.

What is Parallel Computing? - Definition from Techopedia

Parallel computing is a mainstay of modern computation and information analysis and management, ranging from scientific computing to information and data services. The inevitable and rapidly growing adoption of multi-core parallel architectures within a processor chip by all of the computer industry pushes explicit

Princeton COS 598A: Parallel Architecture and Programming

From a hardware perspective, a hybrid parallel architecture refers to the system consisting of a number of machines/PCs with distributed memory interconnected via a network, where each of the machine is a shared memory computer (like SMP) itself, as shown in Fig. 6 a.
