For $b = (2, 3, 5)$ the solutions are $(x, y, z) = (1, 1, 0)$ or $(0, 1, 1)$ and you can add any multiple of $(-1, 0, 1)$. $b = (4, 6, c)$ needs $c = 10$ for solvability (then b lies in the plane of the columns and the three equations add to $0 = 0$). 8 Four planes in 4-dimensional space normally meet at a point.

Linear Algebra | Problems in Mathematics

A solution of a linear system is an assignment of values to the variables x_1, x_2, \dots, x_n such that each of the equations is satisfied. The set of all possible solutions is called the solution set. A linear system may behave in any one of three possible ways: The system has infinitely many solutions. The system has a single unique solution.
